System Modernization

Your enterprise application represents a significant investment...

You have customized your enterprise application to perform the necessary tasks for your general business requirements. However, there are still some issues.

The existing system is not browser based and the user interface is not intuitive, so training is difficult and time consuming. You want some additional features that do not exist in the current system. Upgrading to a new version of the software is an expensive and time consuming task. The upgrade version may compromise some specific and strategic initiatives. The existing system is 'old technology' and therefore it is difficult to find people to maintain it.

Some Solution Parameters

- ◇ Take advantage of new techniques, tools and software without incurring large investments in upfront costs and ongoing costs.
- ◇ Enhance user effectiveness (lower training time with intuitive solutions) at remote locations and within corporate as required.
- ◇ Operate in harmony with your existing application without compromising your current architecture.
- ◇ Improve efficiency and be able to capture ever increasing data points.
- ◇ Extend the life of your enterprise application.
- ◇ Upgrade reporting capabilities.

Realize the Value of Information Hidden in Multiple Data Sources

The Coldwater Technology Solution

Coldwater has created many existing applications that operate in harmony with your existing application.

Your company can have a robust browser application that is tightly integrated with your existing enterprise application for those individuals and departments requiring or desiring state-of-the-art business applications without compromising your current architecture, incurring a large investment or risking the business to a variety of “unknowns”.

Coldwater engineers are problem solvers. They have constructed a platform that allows them to extend your existing enterprise software platforms and add much needed additional functionality. These solutions have helped our customers increase revenues, decrease costs and mitigate risk.

Many companies have taken this approach – modernize as opposed to upgrade – and are enjoying successful implementations without the expense of an upgrade.
